

$$\lambda_{1,2} = \frac{-[(10k\Omega)(100\mu F)] \pm \sqrt{[(10k\Omega)(100\mu F)]^2 - 4(6.8mH)(100\mu F)}}{2(6.8mH)(100\mu F)}$$

$$R = 10 k\Omega$$

$$C = 100 \mu F$$

$$\lambda_1 = -1.00000068, \quad \lambda_2 = -1470587.235$$

$$L = 6.8 mH$$

Caso 1:

$$(RC)^2 - 4LC \geq 0 \quad \therefore [(10k\Omega)(100\mu F)]^2 - 4(6.8mH)(100\mu F) = 0.99999728$$

$$0.99999728 > 0 \longrightarrow \text{sobre amortiguada}$$
